

## ISO/IEC 42001:2023

# Clause 4-10 Evidence Mapping

DoW AI PM Builder Template — Katmai Engagement Readiness

*Jerome Davis | Second Order Strategy*

Prepared: April 2026

---

## Purpose and How to Use This Document

This document maps every clause and sub-clause of ISO/IEC 42001:2023 (Clauses 4 through 10, plus Annex A) to the evidence that the DoW AI PM Builder Template v4.0 generates autonomously, evidence that Katmai Government Services must supply from its own organizational context, and evidence that is partially covered and requires both.

Use it in three ways:

- Engagement Preparation — identify and complete all KATMAI PROVIDES items before the first project build begins.
- Audit Readiness — trace any ISO 42001 audit finding back to the specific agent, file path, or organizational artifact responsible.
- Evidence Package Assembly — the factory's Program Analyst agent and Security & Compliance Officer both reference this mapping when generating Automated Evidence Packages.

### Status Key

**FACTORY GENERATES** — The factory produces this artifact autonomously via its agent pipeline. The file path shown is where it lands in every project repo.

**KATMAI PROVIDES** — This is an organizational artifact. The factory cannot generate it because it requires executive authority, org-level decisions, or real personnel assignments at Katmai.

**PARTIAL** — The factory produces a template or scaffold. Katmai must populate it with real organizational data before it qualifies as evidence.

---

## Clause 4 — Context of the Organization

Clause 4 establishes the organizational foundation for the AI Management System. Most Clause 4 evidence is organizational in nature and cannot be generated by the factory. The factory does produce the AIMS Scope document template and its install-config.json provides a machine-readable registry of all activated AI systems.

| Sub-Clause | ISO 42001 Requirement                                                                                                                                                 | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                              | Status                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| 4.1        | Understanding the organization and its context — identify internal/external issues relevant to AIMS purpose and that affect the ability to achieve intended outcomes. | Katmai must author an Organizational Context Statement naming the internal/external factors that shaped the decision to implement an AIMS (e.g., DoW contract requirements, regulatory environment, competitive posture). No factory output covers this.                                                        | <b>KATMAI PROVIDES</b> |
| 4.2        | Understanding the needs and expectations of interested parties — identify interested parties and their relevant requirements.                                         | Katmai must produce an Interested Parties Register identifying stakeholders (contracting officers, legal, employees, subcontractors, auditors) and documenting their AI-relevant requirements. No factory output covers this.                                                                                   | <b>KATMAI PROVIDES</b> |
| 4.3        | Determining the scope of the AIMS — define boundaries and applicability of the AI management system.                                                                  | PARTIAL: Factory generates .governance/Cross_Cutting/SoA/Gate1_Initial_SoA.md which contains a Scope section referencing all 15 agents and 6 compliance frameworks. Katmai must formalize this as an official AIMS Scope Statement endorsed by leadership, naming the specific AI systems in scope by contract. | <b>PARTIAL</b>         |
| 4.4        | AI management system — establish, implement, maintain and continually improve the AIMS.                                                                               | PARTIAL: The factory IS the AIMS for project-level AI. Katmai must document the organizational decision to adopt it as the enterprise AIMS (an AIMS Adoption Record), reference this template as the governed delivery vehicle, and assign an AIMS Management Representative.                                   | <b>PARTIAL</b>         |

## Clause 5 — Leadership

Clause 5 requires active leadership commitment, a formal AI policy, and clear role assignments. All three are organizational obligations that the factory cannot fulfill on Katmai's behalf. The factory's agent roster provides the governance role model — Katmai must map real names to those roles.

| Sub-Clause | ISO 42001 Requirement                                                                | Factory Output / Agent / File Path                                                                                                                                                                                                            | Status                 |
|------------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| 5.1        | Leadership and commitment — top management shall demonstrate commitment to the AIMS. | Katmai must produce a Leadership Commitment Record: an executive memorandum or board-level decision record designating an AI Program Sponsor, authorizing AIMS resources, and committing to policy compliance. No factory output covers this. | <b>KATMAI PROVIDES</b> |

| Sub-Clause | ISO 42001 Requirement                                                                  | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                                                          | Status                 |
|------------|----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| 5.2        | Policy — establish an AI policy appropriate to the organization's purpose.             | Katmai must author and formally sign a Katmai AI Policy document. It must align with DoW CSRMC, ISO 42001, CMMC 2.0, and FedRAMP requirements. The factory's ai-governance-framework.md can serve as a drafting reference but does not substitute for an org-signed policy.                                                                                                                 | <b>KATMAI PROVIDES</b> |
| 5.3        | Organizational roles, responsibilities and authorities — assign and communicate roles. | PARTIAL: Factory defines the Director role (human oversight authority) and all 15 agent roles with authority boundaries. Katmai must complete a Role Assignment Matrix mapping real Katmai employees to: AIMS Management Representative, Director (human override authority), AI Governance Lead, and Executive Sponsor. The mapping template is derivable from .agent/souls/ descriptions. | <b>PARTIAL</b>         |

## Clause 6 — Planning

Clause 6 covers risk-based planning for the AIMS. The factory provides strong programmatic risk coverage via the Security & Compliance Officer, nist-rmf-analyst.toml, and the CPMAI phase gate structure. The primary gap is that risk and opportunity planning must be documented at the organizational (Katmai) level before project-level evidence is generated.

| Sub-Clause | ISO 42001 Requirement                                                                                           | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                                                            | Status                   |
|------------|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| 6.1        | Actions to address risks and opportunities — determine risks/opportunities relevant to achieving AIMS outcomes. | PARTIAL: Security & Compliance Officer generates Mission Risk Profile and AIMS Risk Assessment at Gate 1 (path: .governance/[Project]/Risk/). nist-rmf-analyst.toml drives GOVERN and MAP functions. Katmai must add an org-level risk register covering enterprise AI risks not specific to any single project (e.g., workforce capability risk, reputational risk, regulatory change risk). | <b>PARTIAL</b>           |
| 6.1.1      | Determination of risks and opportunities related to AI systems — specific to AI context.                        | FACTORY GENERATES: Security & Compliance Officer + nist-rmf-analyst.toml produce NIST AI RMF-aligned risk assessments. Artifacts in .governance/[Project]/Risk/AIMS_Risk_Assessment.md and Mission_Risk_Profile.md.                                                                                                                                                                           | <b>FACTORY GENERATES</b> |
| 6.1.2      | Risk treatment — select and apply risk treatment options.                                                       | FACTORY GENERATES: Security & Compliance Officer produces POA&M (Plan of Action & Milestones) referencing risk treatment decisions. Override Register documents all Fail Closed overrides as risk acceptance records. Artifacts in .governance/[Project]/Compliance/.                                                                                                                         | <b>FACTORY GENERATES</b> |
| 6.2        | AIMS objectives and planning to achieve them —                                                                  | PARTIAL: Program Analyst agent defines CPMAI phase objectives in Phase Gate Reviews. Katmai must document organizational AIMS objectives at the                                                                                                                                                                                                                                               | <b>PARTIAL</b>           |

| Sub-Clause | ISO 42001 Requirement                                                                          | Factory Output / Agent / File Path                                                                                                                                                                                                                                                     | Status                   |
|------------|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
|            | establish measurable objectives at relevant functions.                                         | enterprise level (e.g., achieve ISO 42001 certification by [date], deploy X AI systems with zero ATO failures in FY26) and track them in a formal Objectives Register.                                                                                                                 |                          |
| 6.3        | Planning of changes — planned changes to the AIMS shall be carried out in a controlled manner. | FACTORY GENERATES: Scrum Master enforces change management through Sprint Zero and CPMAI phase gate controls. All spec changes require Definition of Ready re-validation. Architecture SE files ADRs (.governance/[Project]/Architecture/ADR/) for all architectural change decisions. | <b>FACTORY GENERATES</b> |

## Clause 7 — Support

Clause 7 covers the support infrastructure for the AIMS: resources, competence, awareness, communication, and documented information. The factory generates all documented information infrastructure. Competence and awareness evidence requires Katmai to produce records tied to real named individuals.

| Sub-Clause | ISO 42001 Requirement                                                                                      | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                                                           | Status                   |
|------------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| 7.1        | Resources — determine and provide resources needed to establish, implement, maintain and improve the AIMS. | PARTIAL: Factory's install-config.json documents the AI tooling resource baseline. Katmai must produce a Resources Record documenting: budget allocated to AIMS, computing infrastructure designated for AI workloads, and external services (Claude API, GitHub, etc.) authorized for use under the AIMS.                                                                                   | <b>PARTIAL</b>           |
| 7.2        | Competence — determine necessary competence, ensure persons are competent, retain documented evidence.     | KATMAI PROVIDES: Katmai must assemble a Competence Evidence Package. Jerome's certifications (ISO 42001 Lead Auditor, ISO 27001 Lead Auditor, PMI-CPMAI, AWS Certified AI Practitioner, Google Cloud Generative AI Leader, CompTIA SecurityX) constitute the primary competence evidence. These must be formally recorded in an individual competence file with certificate copies attached. | <b>KATMAI PROVIDES</b>   |
| 7.3        | Awareness — ensure persons are aware of the AI policy and their contribution to AIMS effectiveness.        | KATMAI PROVIDES: Katmai must conduct and document AI awareness training for all staff who interact with AI systems. A Training Log recording names, dates, content delivered, and acknowledgment signatures is required. The factory's ai-governance-framework.md can serve as training source material.                                                                                     | <b>KATMAI PROVIDES</b>   |
| 7.4        | Communication — determine internal and                                                                     | FACTORY GENERATES: Program Analyst agent produces Stakeholder Engagement                                                                                                                                                                                                                                                                                                                     | <b>FACTORY GENERATES</b> |

| Sub-Clause | ISO 42001 Requirement                                                                                      | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Status                   |
|------------|------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
|            | external communication requirements.                                                                       | records and escalation communication logs as part of every CPMAI phase. Circuit Breaker Alert protocol (orchestration/circuit-breaker-alert.md) is the documented escalation communication procedure.                                                                                                                                                                                                                                                                                               |                          |
| 7.5        | Documented information — create, update, and control documented information required by the AIMS.          | FACTORY GENERATES: The entire .governance/ directory tree IS the documented information system. Every agent writes to its designated .governance/ path. Document Control: version-controlled via Git (SHA-based immutable audit trail). Retention: GitHub repository history. Format and media: Markdown with structured frontmatter. Creation/Update: agents follow Self-Annealing Protocol (Validate-Execute-Verify-Correct). Control: Triple-Lock Protocol gates all documents before promotion. | <b>FACTORY GENERATES</b> |
| 7.5.1      | Documented information required by the standard — include all ISO 42001-mandated records.                  | FACTORY GENERATES: Program Analyst agent maintains Evidence_Index at .governance/Cross_Cutting/Evidence_Index/ which catalogs all ISO 42001-required records. SEC-49 Governance Baseline Crosswalk identifies all required document types.                                                                                                                                                                                                                                                          | <b>FACTORY GENERATES</b> |
| 7.5.2      | Creating and updating — appropriate identification, format, review and approval of documented information. | FACTORY GENERATES: All documents carry agent-generated metadata headers (version, date, producing agent, applicable phase, compliance frameworks). Triple-Lock Protocol serves as the review-and-approval gate. Git commit history provides immutable creation/update audit trail.                                                                                                                                                                                                                  | <b>FACTORY GENERATES</b> |
| 7.5.3      | Control of documented information — availability, protection, distribution, retention.                     | FACTORY GENERATES: Git version control provides availability, protection (private repo access control), and retention. .governance/ directory structure enforces logical distribution (each agent type writes only to its designated path). Repository-level access controls enforce need-to-know.                                                                                                                                                                                                  | <b>FACTORY GENERATES</b> |

## Clause 8 — Operation

Clause 8 is where the factory provides its strongest evidence coverage. Operational planning, AI risk assessment, AI system design, impact assessment, and supply chain controls are all addressed by specific agents with dedicated TOML execution packages.

| Sub-Clause | ISO 42001 Requirement    | Factory Output / Agent / File Path                                                          | Status                   |
|------------|--------------------------|---------------------------------------------------------------------------------------------|--------------------------|
| 8.1        | Operational planning and | FACTORY GENERATES: Sprint Zero Playbook (orchestration/sprint-zero-playbook.md) defines all | <b>FACTORY GENERATES</b> |

| Sub-Clause | ISO 42001 Requirement                                                                   | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                                                                                       | Status            |
|------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
|            | control — plan, implement, control and review processes.                                | operational processes. CPMAI 6-phase lifecycle enforces operational sequencing. Triple-Lock Protocol controls process execution. Self-Annealing Protocol (Validate-Execute-Verify-Correct) governs every agent operation.                                                                                                                                                                                                |                   |
| 8.2        | AI risk assessment — conduct AI risk assessments at planned intervals.                  | FACTORY GENERATES: Security & Compliance Officer + nist-rmf-analyst.toml perform NIST AI RMF-aligned risk assessment at every phase gate. Artifacts: .governance/[Project]/Risk/AIMS_Risk_Assessment.md, Mission_Risk_Profile.md. Assessment triggers: Gate entry, material system change, Security Officer determination.                                                                                               | FACTORY GENERATES |
| 8.3        | AI risk treatment — implement risk treatment plan.                                      | FACTORY GENERATES: Security & Compliance Officer issues Phase Gate Compliance Stamps only when all risk treatments are documented. POA&M tracks open treatments. Override Register records accepted risks with Director authorization. Artifacts: .governance/[Project]/Compliance/POA&M.md, Override_Register.md.                                                                                                       | FACTORY GENERATES |
| 8.4        | AI system impact assessment — assess impact on individuals, groups and society.         | PARTIAL: Security & Compliance Officer evaluates bias risks (NIST SP 1270) and fairness controls via dod-compliance-auditor.toml. nist-rmf-analyst.toml covers societal impact framing. Katmai must formally document the intended use population for each AI system and authorize deployment scope before Gate 2. The Security Officer's 12-item Quality Gate Checklist requires this before issuing compliance stamps. | PARTIAL           |
| 8.5        | AI system life cycle — manage AI systems through their full life cycle.                 | FACTORY GENERATES: CPMAI v7 6-phase lifecycle IS the AI system lifecycle framework. Each phase has defined entry/exit criteria enforced by phase gates. Performance DevOps monitors production lifecycle health (CCV, telemetry per DoW CSRMC). All lifecycle phases produce governance artifacts in .governance/.                                                                                                       | FACTORY GENERATES |
| 8.6        | Responsible AI by design — address responsible AI principles during design.             | FACTORY GENERATES: Architecture SE files ADRs that must include responsible AI design decisions. Security Officer owns the Multi-Framework Waterfall which enforces responsible AI controls from all 6 compliance frameworks simultaneously. 'Fail Closed' is itself a responsible AI design principle — defaults block rather than permit when compliance is unconfirmed.                                               | FACTORY GENERATES |
| 8.7        | Suppliers and third parties — manage AI-related risks from suppliers and third parties. | PARTIAL: Factory's install-config.json documents the AI tooling supply chain (Claude, GitHub, VoltAgent specializations). Security Officer reviews supplier risk in the Multi-Framework Waterfall. Katmai must maintain a formal Approved Vendor Register at the organizational level (not project level) authorizing each AI tool/service for use under DoW contracts.                                                  | PARTIAL           |

## Clause 9 — Performance Evaluation

Clause 9 covers monitoring, measurement, internal audit, and management review. The factory generates strong performance evaluation infrastructure through its Performance DevOps agent, Security & Compliance Officer audit role, and Program Analyst Phase Gate Reviews.

| Sub-Clause | ISO 42001 Requirement                                                                                      | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                           | Status                   |
|------------|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| 9.1        | Monitoring, measurement, analysis and evaluation — determine what needs to be monitored and how.           | FACTORY GENERATES: Performance DevOps agent monitors continuous compliance via CCV (Continuous Compliance Validation) per DoW CSRMC. Telemetry framework captures AI system behavior metrics. Artifacts in .governance/[Project]/Performance/. Security Officer's 30+ output types include monitoring reports.                                               | <b>FACTORY GENERATES</b> |
| 9.2        | Internal audit — conduct internal audits at planned intervals.                                             | FACTORY GENERATES: Security & Compliance Officer activates iso42001-auditor.toml for ISO 42001-specific audit functions. Audit scope defined by the Triple-Lock Protocol gate reviews. Audit findings feed into Phase Gate blocking decisions. Audit records in .governance/[Project]/Compliance/Audit/.                                                     | <b>FACTORY GENERATES</b> |
| 9.2.1      | Internal audit programme — establish, implement and maintain an audit programme.                           | PARTIAL: Security Officer generates per-project audit plans. Katmai must establish an AIMS-level audit schedule (e.g., quarterly internal audit cycle across all active AI projects) and designate a Lead Auditor role. Jerome's ISO 42001 Lead Auditor certification qualifies him for this role.                                                           | <b>PARTIAL</b>           |
| 9.3        | Management review — top management shall review the AIMS at planned intervals.                             | PARTIAL: Program Analyst generates Phase Gate Reviews which function as management review records at the project level. Katmai's executive sponsor must conduct and document formal AIMS Management Reviews at the organizational level (minimum annually per ISO 42001). A Management Review Minutes template can be derived from Phase Gate Review format. | <b>PARTIAL</b>           |
| 9.3.1      | Management review inputs — review inputs include: audit results, stakeholder feedback, performance trends. | FACTORY GENERATES: Phase Gate Reviews aggregate all required inputs: audit results (Security Officer stamps), performance metrics (Performance DevOps), nonconformity log (Override Register, POA&M), AIMS objectives progress (Program Analyst).                                                                                                            | <b>FACTORY GENERATES</b> |
| 9.3.2      | Management review outputs — outputs include decisions and actions related to AIMS improvement.             | PARTIAL: Phase Gate Reviews contain action assignments. Katmai's executive management review must produce formal documented decisions (continue/pause/terminate AI programs, resource adjustments, policy changes).                                                                                                                                          | <b>PARTIAL</b>           |

| Sub-Clause | ISO 42001 Requirement | Factory Output / Agent / File Path                                          | Status |
|------------|-----------------------|-----------------------------------------------------------------------------|--------|
|            |                       | These must be recorded at the organizational level, not just project level. |        |

## Clause 10 — Improvement

Clause 10 requires a systematic approach to nonconformity correction and continual improvement of the AIMS. The factory's Self-Annealing Protocol, Override Register, and POA&M process provide strong coverage. The primary gap is that continual improvement must be documented at the organizational level.

| Sub-Clause | ISO 42001 Requirement                                                                                | Factory Output / Agent / File Path                                                                                                                                                                                                                                                                                                                                                     | Status                   |
|------------|------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| 10.1       | Nonconformity and corrective action — react to nonconformities, take corrective action.              | FACTORY GENERATES: Self-Annealing Protocol (Validate-Execute-Verify-Correct) IS the corrective action mechanism. Every agent failure triggers self-correction. Three consecutive failures escalate via Circuit Breaker Alert to human Director. All overrides to Fail Closed blocks are documented in Override_Register.md with Director authorization.                                | <b>FACTORY GENERATES</b> |
| 10.2       | Continual improvement — continually improve the suitability, adequacy and effectiveness of the AIMS. | PARTIAL: Factory's template-only policy (no direct modifications — improvements come from findings during certification and audits) is itself a continual improvement governance model. Katmai must maintain an AIMS Improvement Log documenting improvement decisions made as a result of audit findings, management reviews, and nonconformity analysis at the organizational level. | <b>PARTIAL</b>           |

## Annex A — AI-Specific Controls

ISO/IEC 42001 Annex A contains 18 AI-specific controls organized into 9 domains. These controls are what distinguish ISO 42001 from general management system standards. The factory provides exceptionally strong coverage of Annex A because its architecture was purpose-built around AI lifecycle governance.

| Control | Title                 | Factory Implementation                                                                                                                                                                                                      | Status                   |
|---------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| A.2     | Policies for AI       | ai-governance-framework.md (Enterprise AI Governance & Lifecycle Management Framework v1.1.1). Authored by Jerome Davis. Governs all 15 agents. Katmai must formally adopt this as the organizational AI policy instrument. | <b>PARTIAL</b>           |
| A.3     | Internal organization | Agent roster with defined roles, separation of powers (developer cannot approve own code),                                                                                                                                  | <b>FACTORY GENERATES</b> |

| Control | Title                                            | Factory Implementation                                                                                                                                                                                                                   | Status                   |
|---------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
|         |                                                  | Director override authority. .agent/souls/ define all role boundaries.                                                                                                                                                                   |                          |
| A.4     | Resources for AI systems                         | install-config.json documents AI tooling resource baseline. Performance DevOps monitors resource allocation and utilization.                                                                                                             | <b>PARTIAL</b>           |
| A.5     | Assessing impacts of AI systems                  | Security Officer + nist-rmf-analyst.toml execute NIST AI RMF MAP function (societal impact analysis). NIST SP 1270 bias assessment via dod-compliance-auditor.toml.                                                                      | <b>PARTIAL</b>           |
| A.6     | AI system life cycle                             | CPMAI v7 6-phase lifecycle enforced by all 15 agents. Phase Gates are the lifecycle control points. Sprint Zero Playbook defines lifecycle entry.                                                                                        | <b>FACTORY GENERATES</b> |
| A.7     | Data for AI systems                              | Database Engineer locks schema at Gate 2. Requirements BA and User Story BA define data requirements in Discovery Phase. Documented in .governance/[Project]/Data/.                                                                      | <b>FACTORY GENERATES</b> |
| A.8     | Information for interested parties of AI systems | Program Analyst generates stakeholder-facing Phase Gate Reviews. Scrum Master manages stakeholder communication. Circuit Breaker Alert is the adverse event notification mechanism.                                                      | <b>FACTORY GENERATES</b> |
| A.9     | Use of AI systems                                | Security Officer Fail Closed Protocol enforces authorized use only. Every deployment requires explicit Phase Gate Compliance Stamp. Override Register documents any authorized deviation.                                                | <b>FACTORY GENERATES</b> |
| A.10    | Third-party and customer relationships           | Security Officer Multi-Framework Waterfall includes supply chain risk (DoW CSRMC). Katmai must maintain Approved Vendor Register for org-level authorization.                                                                            | <b>PARTIAL</b>           |
| A.11    | Incident management                              | Circuit Breaker Alert (3-failure escalation) is the AI incident detection and response mechanism. Self-Annealing Protocol is first-line incident response. Escalation path documented in orchestration/escalation-template.md.           | <b>FACTORY GENERATES</b> |
| A.12    | Compliance                                       | Security Officer activates 4 specialized compliance TOMLs: iso42001-auditor.toml, nist-rmf-analyst.toml, dod-compliance-auditor.toml, ato-documentation-specialist.toml. Multi-Framework Waterfall enforces 6 frameworks simultaneously. | <b>FACTORY GENERATES</b> |
| A.13    | Performance evaluation of AI system              | Performance DevOps CCV + telemetry per DoW CSRMC. Security Officer 30+ output types include performance reports. Phase Gate Reviews contain performance evaluation sections.                                                             | <b>FACTORY GENERATES</b> |

| Control | Title           | Factory Implementation                                                                                                                                                                                                       | Status                   |
|---------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| A.14    | Risk management | Security Officer + nist-rmf-analyst.toml execute full NIST AI RMF (Govern-Map-Measure-Manage). Mission Risk Profile per DoW CSRMC. Gate 1 AIMS Risk Assessment.                                                              | <b>FACTORY GENERATES</b> |
| A.15    | AI governance   | Program Analyst agent IS the governance layer. Phase Gate Reviews, SoA, Evidence Index, and Automated Evidence Package are all generated governance artifacts. Fail Closed Protocol is the governance enforcement mechanism. | <b>FACTORY GENERATES</b> |

## Gap Register — Katmai Organizational Requirements

The following gaps represent evidence items that the factory cannot generate because they require organizational authority, real personnel assignments, or Katmai-specific decisions. All HIGH priority items must be resolved before the first project build begins. MEDIUM items should be resolved before the first Phase Gate 2 review.

| Gap ID | Clause(s) | Description                                                                                              | Owner             | Priority      | Pre-Engagement? |
|--------|-----------|----------------------------------------------------------------------------------------------------------|-------------------|---------------|-----------------|
| G-01   | 4.1       | Organizational Context Statement — internal and external issues relevant to AIMS purpose                 | AIMS Rep          | <b>HIGH</b>   | <b>YES</b>      |
| G-02   | 4.2       | Interested Parties Register — stakeholders and their AI-relevant requirements                            | AIMS Rep          | <b>HIGH</b>   | <b>YES</b>      |
| G-03   | 4.3, 4.4  | Formal AIMS Scope Statement (endorsed by leadership) and AIMS Adoption Record                            | Executive Sponsor | <b>HIGH</b>   | <b>YES</b>      |
| G-04   | 5.1       | Leadership Commitment Record — executive memorandum designating AI Program Sponsor                       | Executive Sponsor | <b>HIGH</b>   | <b>YES</b>      |
| G-05   | 5.2       | Katmai AI Policy — formally signed, aligned to DoW CSRMC/ISO 42001/CMMC 2.0/FedRAMP                      | Executive Sponsor | <b>HIGH</b>   | <b>YES</b>      |
| G-06   | 5.3       | Role Assignment Matrix — real Katmai employees mapped to AIMS Rep, Director, AI Governance Lead, Sponsor | AIMS Rep          | <b>HIGH</b>   | <b>YES</b>      |
| G-07   | 7.2       | Competence Evidence Package — certificate copies + formal competence records for AIMS personnel          | AIMS Rep          | <b>HIGH</b>   | <b>YES</b>      |
| G-08   | 7.3       | AI Awareness Training Log — staff training records with names, dates, acknowledgments                    | AIMS Rep          | <b>MEDIUM</b> | <b>NO</b>       |

| Gap ID | Clause(s) | Description                                                                                                    | Owner             | Priority | Pre-Engagement? |
|--------|-----------|----------------------------------------------------------------------------------------------------------------|-------------------|----------|-----------------|
| G-09   | 7.1       | Resources Record — budget, infrastructure, and authorized external services documentation                      | AIMS Rep          | MEDIUM   | NO              |
| G-10   | 6.2       | Organizational AIMS Objectives Register — enterprise-level measurable AI objectives with targets and timelines | AIMS Rep          | MEDIUM   | NO              |
| G-11   | 8.7       | Approved Vendor Register — org-level authorization of each AI tool/service for DoW contract use                | AIMS Rep          | HIGH     | YES             |
| G-12   | 9.2.1     | AIMS Audit Schedule — planned audit cycle across all active AI projects with Lead Auditor designation          | AIMS Rep          | MEDIUM   | NO              |
| G-13   | 9.3       | Management Review Process — documented schedule and charter for org-level AIMS management reviews              | Executive Sponsor | MEDIUM   | NO              |
| G-14   | 10.2      | AIMS Improvement Log — org-level record of AIMS improvement decisions from audits and reviews                  | AIMS Rep          | LOW      | NO              |

## Pre-Engagement Action Plan

This is the ordered sequence of actions Katmai must complete before the first project build begins. Items are sequenced by dependency — leadership authorization must come before role assignments, policy before scope, etc. Items 1-6 constitute the minimum viable AIMS baseline for ISO 42001 audit readiness.

| # | Action                                                                                                                                                              | Clause(s) | Owner             | Artifact to Create                                       |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------------|----------------------------------------------------------|
| 1 | Designate Executive Sponsor — identify the Katmai executive who will serve as AI Program Sponsor and AIMS top management representative.                            | 5.1       | Executive Team    | Leadership Commitment Memo (signed) — References G-04    |
| 2 | Assign AIMS Management Representative — designate Jerome Davis or other qualified individual as AIMS Management Representative with formal authority documentation. | 5.3       | Executive Sponsor | Role Assignment Memo + Job Description — References G-06 |
| 3 | Draft and sign Katmai AI Policy — use ai-governance-framework.md as the drafting foundation. Must be formally                                                       | 5.2       | AIMS Rep + Legal  | Katmai_AI_Policy_v1.0.docx (signed) — References G-05    |

| #  | Action                                                                                                                                                                                                                                                        | Clause(s)        | Owner                        | Artifact to Create                                                                  |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|------------------------------|-------------------------------------------------------------------------------------|
|    | signed by the Executive Sponsor.                                                                                                                                                                                                                              |                  |                              |                                                                                     |
| 4  | Write Organizational Context Statement — document the internal/external factors (DoW contract requirements, regulatory environment) that drive the AIMS.                                                                                                      | 4.1              | AIMS Rep                     | AIMS_Organizational_Context.md — References G-01                                    |
| 5  | Build Interested Parties Register — list all stakeholders with AI-relevant requirements (contracting officers, DCSA, auditors, program staff, subcontractors).                                                                                                | 4.2              | AIMS Rep                     | Interested_Parties_Register.xlsx — References G-02                                  |
| 6  | Formalize AIMS Scope and Adoption Record — convert the factory's Gate1_Initial_SoA.md scope section into a signed AIMS Scope Statement. Document the organizational decision to adopt the DoW AI PM Builder Template as the enterprise AIMS delivery vehicle. | 4.3, 4.4         | Executive Sponsor + AIMS Rep | AIMS_Scope_Statement.docx (signed) + AIMS_Adoption_Record.md — References G-03      |
| 7  | Assemble Competence Evidence Package — compile certificate copies for all AIMS personnel. Jerome: ISO 42001 Lead Auditor, ISO 27001 Lead Auditor, PMI-CPMAI, AWS Certified AI Practitioner, Google Cloud Generative AI Leader, CompTIA SecurityX.             | 7.2              | AIMS Rep                     | Competence_Evidence_Package/ (folder with PDFs) — References G-07                   |
| 8  | Create Approved Vendor Register — document organizational authorization for each AI tool/service: Claude (Anthropic), GitHub, and any future services. Include contractual basis and data handling assessment for each.                                       | 8.7              | AIMS Rep + Legal             | Approved_Vendor_Register.xlsx — References G-11                                     |
| 9  | Complete Role Assignment Matrix — map real Katmai employees to all governance roles: AIMS Management Representative, Director (human override authority for factory), AI Governance Lead, Executive Sponsor, Internal Auditor.                                | 5.3              | AIMS Rep                     | AIMS_Role_Assignment_Matrix.xlsx — References G-06                                  |
| 10 | Run factory Sprint Zero on first Katmai project — the factory will generate all Clause 8-9 artifacts                                                                                                                                                          | 8.1-8.7, 9.1-9.2 | Jerome (Director)            | Sprint Zero complete + Gate 1 Compliance Stamp in .governance/[Project]/Compliance/ |

| # | Action                                                                                                                                        | Clause(s) | Owner | Artifact to Create |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------|--------------------|
|   | automatically. Confirm .governance/ directory structure is populating correctly and Phase Gate 1 Compliance Stamp is issued without override. |           |       |                    |

*Note: Items 1-9 are Katmai organizational prerequisites. Item 10 is the first factory execution. After Sprint Zero completes, the factory will have generated the bulk of Clause 8 and 9 evidence automatically. The remaining MEDIUM and LOW priority gaps (G-08 through G-14) can be addressed over the first 30-60 days of the engagement.*

## Coverage Summary

The table below summarizes factory vs. organizational coverage by clause group.

| Clause Group            | FACTORY GENERATES     | PARTIAL               | KATMAI PROVIDES |
|-------------------------|-----------------------|-----------------------|-----------------|
| Clause 4 — Context      | 0                     | 2 (4.3, 4.4)          | 2 (4.1, 4.2)    |
| Clause 5 — Leadership   | 0                     | 1 (5.3)               | 2 (5.1, 5.2)    |
| Clause 6 — Planning     | 3 (6.1.1, 6.1.2, 6.3) | 2 (6.1, 6.2)          | 0               |
| Clause 7 — Support      | 5 (7.4, 7.5, 7.5.1-3) | 1 (7.1)               | 2 (7.2, 7.3)    |
| Clause 8 — Operation    | 5 (8.1-8.3, 8.5, 8.6) | 2 (8.4, 8.7)          | 0               |
| Clause 9 — Evaluation   | 3 (9.1, 9.2, 9.3.1)   | 3 (9.2.1, 9.3, 9.3.2) | 0               |
| Clause 10 — Improvement | 1 (10.1)              | 1 (10.2)              | 0               |
| Annex A — AI Controls   | 10 of 15 listed       | 5 of 15 listed        | 0               |

*Key insight: The factory generates or partially generates evidence for every Clause 6-10 requirement. Clauses 4 and 5 are the organizational foundation layer — they cannot be automated because they require executive authority and organizational decisions. Completing the 10-item Pre-Engagement Action Plan addresses all HIGH priority gaps and positions Katmai for a clean Phase Gate 1 on the first project build.*

Document Classification: Katmai Government Services — Internal Use

Factory Version: DoW AI PM Builder Template v4.0 | Standard Version: ISO/IEC 42001:2023
